

## FM3-1993 Fixing Film Unit Installation

To **prevent damage** to the **film** and/or **element**, and **avoid E003** errors at installation or shortly thereafter, *please pay special attention to the following:*

For proper installation of the Fixing Separation Guide, please refer to the illustration below. After installing the Fixing Separation Guide, assure it seats comfortably into the end cap channels. *(An incorrectly installed guide will cause the spring to expand awkwardly.)*

Please use the included **mylar sheet** to place on top of the film unit after installing the film unit, but before placing the shutter unit in to position.

This will **protect the film** from being damaged by the shutter unit.

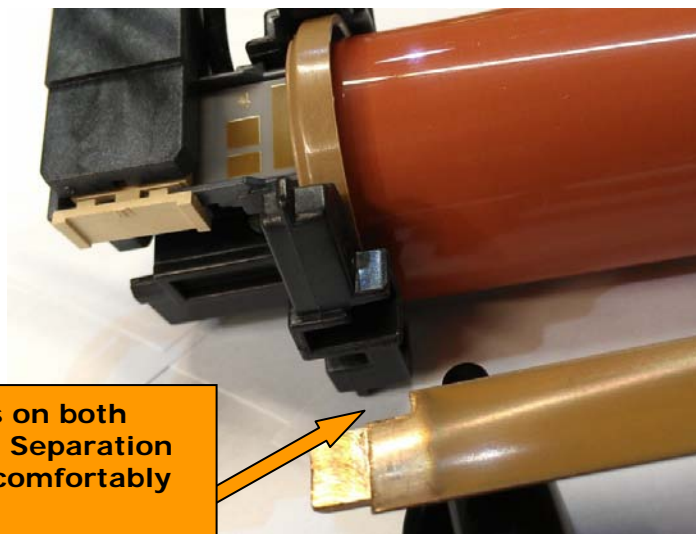

Make a visual check of both black connectors at the ends of the film unit after installation! The tabs on the connectors should lock themselves on the caps. These connectors do not need to be removed in order to install the film unit.

However, they can become loose during shipping or installation.

The element and its housing are very fragile; please use special care when locking these connectors in place. Failure to fully seat and lock both connectors on the film unit will result in poor contact. This can cause an immediate **E003** after install or cause the element to eventually arc and destroy the film unit!

Fixing Separation Guide

There are notches on both ends of the Fixing Separation Guide. They seat comfortably into the end caps.
